Neurocognitive and Functional Heterogeneity in Depressed Youth

Erica Baller

02/15/2020

This is the master document containing the final analyses for the project: Neurocognitive and Functional Heterogeneity in Depressed Youth

Steps:

1) Sample construction

- We started with the CNB sample (9498 youths aged 8-22)
- Youths were excluded if they did not have age, sex, gender or maternal education documented
- Youths were also excluded if they had missing data for any of the 26 cognitive measures (12 accuracy, 14 speed)
- 712 depressed youths and 2310 remained (n = 3022)

2) Matching

- Using the R package Matchit, depressed youths were age and sex matched with typically developing youth
- Match was performed in 2 steps to allow us to enrich our TD group with children who had imaging
- Step 1: Depressed youth with imaging(200) were matched with youths with imaging. Results: 187 depressed and 187 TDs matched
- Step 2: People who were matched in Step 1 were removed from the original groups (unmatched: Depressed 525, TD 2123)
- Step 3: Subjects from TD group that did not have imaging were removed
- Step 4: Match was rerun for depressed without imaging with TDs WITH imaging
- Step 5: Groups were combined and demographics were checked to ensure that the groups were still matched
- Of note: Matchit does depend on random seeding, so each iteration generates VERY SLIGHT differences between groups
- Our Matchit was run 6/11/2018
- Final TD (n = 712) and Depressed (n = 712), for a total n = 1424

3) HYDRA

- Final matched groups were output to csv and sent to HYDRA for subtyping
- The HYDRA code can be found at https://github.com/evarol/HYDRA

4) Cognitive analysis

- Results from HYDRA revealed highest ARI (0.39) for 3 subtype solution
- CNB Factor Summary Scores (Accuracy, Speed, Efficiency) were evaluated
- Results:
- Subtype 1: Cognition Preserved
- Subtype 2: Cognition Impaired
- Subtype 3: Impulsive

5) Clinical bifactor analysis

- Bifactor scores were calculated (excluding measures that were used to classify depression in initial sample construction)

- Subtypes were evaluated on 5 bifactor scores (anxious-misery, psychosis, externalizing, fear, and overall psychopathology)
- Results:
- ANOVA showed significant between group differences for anxious-misery, externalizing, fear and overall (P(FDR) <0.05)
- Pairwise (Tukey) -All subtypes had higher psychopathology than TDs (P(FDR)< 0.05)
  - Subtypes 1 and 3 were indistinguishable on clinical factor scores (P = NS)
  - Subtype 1 had higher anxious-misery scores than Subtype 2 (P=0.030)
  - Subtype 2 had higher fear scores than Subtypes 1 and 3 (P<0.0001)

6) Anxious-misery analysis

- Anxious-misery factor scores were calculated separately from the State-Trait Anxiety Inventory (STAI)
- Subtypes were evaluated on state and trait factors to verify cognitive differences were not due to current or lifetime anxious-misery
- Results:
- All subtypes had significantly higher state (P(FDR) = 0.001) and trait (P(FDR)<0.001) anxiety
  - State Pairwise:
  - Subtype 1 vs TD (P=0.03)
  - Subtype 2 vs TD (P=0.02)
  - Subtype 3 vs TD (P=0.08, NS)
  - Trait Pairwise: All Subtypes vs TD (P<0.001)
- Subtypes 1-3 did NOT differ on EITHER state or trait anxiety (P=NS)

7) Nback

- Using 21 functionally defined regions of interest from Satterthwaite et al, 2013, percent signal change between 2bk and 0bk was evaluated by subtype
- Results:
- 6 areas showed significant differences (P(FDR)<0.05) by subtype including
  - right crus II
  - right precuneus
  - left precuneus
  - dorsal anterior cingulate
  - left dorsal frontal/mfg
  - left dorsolateral prefrontal cortex
- Effect size analysis also present

8) Nback age-by-sex

- For each of the 6 regions that showed between group differences that survived FDR correction (P(FDR) <0.05)), age by sex interactions were evaluated
- Results: -For all areas, (P(FDR) > 0.05)

9) Nback age-by-group analysis

- For each of the 6 regions that showed between group differences that survived FDR correction (P(FDR) <0.05)), age by group interactions were evaluated
- Results: -For all areas, (P(FDR) > 0.05)

10) Nback movement analysis

- For each of the 6 regions that showed between group differences that survived FDR correction (P(FDR) <0.05)), movement analyses were conducted
- Results: -For all areas, (P(FDR) > 0.05)

11) Nback performance (DPrime)

- Nback performance results during the task were calculated by subtype
- Results:

- Dprime measure map on to brain imaging findings and cognitive findings
  - DPrime Subtype 2 < Subtype 3 < TD < Subtype 1
